

You will be given a text passage from a regulatory document and need to identify its relevancy for a given process and business context. The process and its elements will be described in textual form.

The requirement text passage can come from different documents. A bit of context about the document and section the text passage is extracted from will be given and should be taken into consideration.

We distinguish two kinds of relevancy:

- compliance relevant = this is the description of an action an organizations has to fullfill in order to be compliant with the regulation

- informative relevant = these texts contain information related to the process but don't require a clear action by the organization, they may refere to compliance relevant texts.

A text should only be considered relevant if it is concerned with the specific business context and the specific matter of the given business process. A general/loose requirement for the business that is not an action of the process should not be considered relevant.

Recall is the most important measurement for this task, so when very uncertain rather label subprocess and events as relevant then as irrelevant.

The task is to...

A) ...identify if a regulatory text passage from a regulatory document is relevant or not relevant for the described process

if A) == relevant:

B)...identify the subprocess (e.g. 3) it is relevant for (can be multiple)

C)...identify the specific task (e.g. 3.1) it is relevant for (can be multiple) and wether it is informative relevant or compliance relevant

if A) == not relevant:

...not further analysis needed

Print your result like this:

process relevance: yes/no

if yes:

compliance/informative relevant for the following subprocess (e.g. 1) and task(s) and/or throwing event(s) (e.g. 1.1):
